GIANT SCREEN FILMS presents

DINOSAURS Alive!

A GIGANTIC ADVENTURE

Major funding provided by the National Science Foundation

Inside: Poster and Activities!

www.dinosalive.com/education
KEY CONCEPTS

Use these concepts to help connect the film to your science curriculum. They convey the educational themes in *Dinosaurs Alive!*

1. **Science is an Ongoing Process**

Scientific knowledge changes over time as new evidence becomes available. Paleontologists are unearthing new fossils all the time, and one find can sometimes change our entire understanding of ancient animals. Recent discoveries have provided startling new clues about how dinosaurs looked, moved, and behaved. Paleontologists also develop new ideas by reexamining fossils that were unearthed long ago.

2. **Tools and Technologies Enable Scientists to Make Observations and Discoveries**

Scientists have been using shovels, brushes, and compasses for over 150 years and continue to use them today. In addition, cutting edge technologies provide paleontologists with new ways to find and examine fossils. Global Positioning Systems (GPS) linked to satellites help teams navigate to dig sites and pinpoint exactly where particular fossils were found. Advanced imaging, such as digital x-rays and CAT scans, offer 3D images of fossils without damaging them.

3. **Fossils Provide Clues as to How Dinosaurs Live**

Paleontologists are like detectives. They examine the evidence that extinct animals left behind, such as fossilized bone, shell, skin impression, and feather evidence. Scientists study jaws and teeth to determine what a dinosaur might have eaten. By studying footprints, scientists can estimate the size of the dinosaur, its speed, and aspects of its behavior. And coprolites (fossilized dung) can provide clues to its maker’s diet.

*ABOUT THE FILM*

*Dinosaurs Alive* is a global adventure of science and discovery. From the sand dunes of Mongolia’s Gobi Desert to the sandstone buttes of New Mexico, follow American Museum of Natural History paleontologists (above) as they uncover some of the greatest dinosaur finds in history. Then experience these amazing creatures on the big screen through the power of computer-generated imagery.
4. The Earth Has a Vast History

Scientists estimate the age of the Earth to be about 4.5 billion years. To describe Earth’s long history, scientists use a geologic timescale. They divide time into long segments called eras. Each era is further divided into periods. Different Earth events and organisms characterize each period. Dinosaurs appeared roughly 230 million years ago during the Mesozoic Era. Modern humans have only been on Earth for about 150,000 years.

ACTIVITY CONNECTIONS

• OBSERVE A DINOSAUR: Students learn that dinosaurs are not extinct by investigating the relationship between modern birds and ancient dinosaurs. They then observe birds to infer dinosaur behavior, and be reminded that fossils provide clues as to how dinosaurs live. Time Frame: 2 class periods

• SOLVE A SEDIMENTARY LAYERS PUZZLE: Students experience the ongoing process of science as they analyze fossils. The strategy students use to reconstruct the layers is the same strategy scientists use to reconstruct geologic history from fossils. Time Frame: 1 class period

• CREATE A TIMELINE OF THE EARTH: Student teams examine Earth’s vast history and the diversity of dinosaurs and other life forms by researching major Earth events and organism groups. Teams can then display their poster presentations in chronologic order to illustrate the Earth’s history. Time Frame: 2 class periods plus outside outreach

• FLESH OUT A FOSSIL: Students try their own hand at fleshing out a fossil as they explore how artists create realistic dinosaur drawings from fossil skeletons. Time Frame: 1 class period

5. Dinosaurs Are Diverse

Dinosaurs are a highly successful group of animals with a vast array of physical features. There were small carnivorous dinosaurs the size of a pigeon and massive herbivorous dinosaurs as long as three school buses. Their diverse body features, such as crests, crowns, and horns, were used for both display and defense. Some walked on four limbs, others walked on two. Their diversity allowed them to live in a range of landscapes, in varied climates, and on every continent.

6. Birds Are Living Dinosaurs

Dinosaurs are not extinct. Birds are descendants of small carnivorous dinosaurs that lived over 140 million years ago. Birds survived the catastrophic extinction event that wiped out almost half of Earth’s plant and animal species, among them, the non-avian dinosaurs.
How did ancient dinosaurs move and behave? To find out, paleontologists look for clues in fossils, such as fossilized footprints, eggs, and even dung. They also observe and analyze the movement and behavior of living dinosaurs and other animals. These data help paleontologists interpret the fossil evidence.

You can also observe living dinosaurs. Go outdoors to find birds in their natural habitat. (Or you can use online bird videos, such as the Cornell Lab of Ornithology’s video gallery at www.birds.cornell.edu/AllAboutBirds/BirdGuide/VideoGallery.html)

1. Record Your Observations
   In a notebook, first record information about the environment:
   • Date and Time
   • Location and Habitat
   • Weather and temperature

   Then observe a bird and record:
   • How does the bird move?
   • What does the bird eat?
   • Is the bird alone or in a group?
   • How does the bird behave with members of its species?
   • How does the bird behave with members of other species?

   Tips:
   • Weather conditions can affect how animals behave. Try observing birds in different conditions and different times of day.
   • To collect good data, try to observe similar groups of birds two or three times.

2. Analyze Your Data
   What can you conclude about bird behavior? What clues to this behavior might be preserved in the rock record (e.g. footprints)?

   The heaviest dinosaurs, such as Argentinosaurus, may have weighed up to 100 tons. That’s as heavy as 15 elephants! The lightest dinosaur, the hummingbird, weighs about 4 grams. That’s less than the weight of a nickel!

   What Evidence Indicates That Birds Are Dinosaurs?
   Over 125 years ago, paleontologists made a startling discovery. They recognized that the physical characteristics of modern birds and a species of small carnivorous dinosaur were alike.

   Take a look at the skeletons of roadrunner (a modern bird) and Coelophysis (an extinct dinosaur) to explore some of these shared characteristics. Check out the bones labeled on the roadrunner.

   Can you find and label similar bones on the Coelophysis?
Did you know that the history of life on Earth is told through rocks?

Over millions of years, sediments such as sand and silt were laid down and compressed to form sedimentary rock layers. They preserve a record of ancient landscapes, climates, and organisms.

Scientists often determine the correct sequence of sedimentary rock layers using the fossils found within them. They compare the fossils to figure out if two layers are from the same geologic time period, or if one layer is older than the other.

Try reconstructing the layers below using the same strategy!

1. Photocopy and cut out the five strips of paper
   Each strip represents a sedimentary rock layer formed during a certain time period.

2. Put the layers in correct order
   Begin by placing B, the “oldest layer,” on the bottom. Then decide which layer comes next. It will have some of the same organisms as the older layer and some new ones. (Hint: Organisms do not disappear for a layer and then reappear.) Place it above. Continue until the layers are in order, with the youngest at the top. Check your answers and write the time period on each layer.

Explore More!

Look at the fossils within each layer. What plants and animals lived during the same time period? Then compare the layers to explore the changing plant and animal groups throughout Earth’s history. Which organisms survived from one time period to the next? Which ones went extinct? Could Tarbosaurus have hunted Seismosaurus? What organisms survived the mass extinction at the end of the Cretaceous Period?

**Fun Fact**

Dinosaur fossils have been discovered on every continent, even Antarctica.

**Answers:**

Order of layers from top to bottom: D (Quaternary Period, 2 million years ago to present), E (Triassic Period, 250-200 mya), C (Jurassic Period 155-65 mya), B (Jurassic Period 200-155 mya), and A (Triassic Period 250-200 mya).
CREATE A TIMELINE OF THE EARTH

Our planet Earth formed about 4.5 billion years ago. That’s a really, really long time ago! To help picture it, imagine the entire history of the Earth squeezed into just twelve hours, from noon to midnight. When we think of time in this way, humans have only been around for about a minute!

To describe Earth’s vast history, scientists use a geologic timescale. They divide it into long segments of time called eras. Each era is further divided into periods.

Earth events and organisms characterize each era and period. For example, the Mesozoic Era starts after an extinction event that wiped out almost 90% of species on Earth. Dinosaurs then flourished until the end of the Mesozoic Era, which is marked by another major extinction event. Most dinosaurs went extinct but one group of dinosaurs—birds—survived.

Working in a small team, you will create a poster presentation about one of the periods. You can use classroom and library resources, as well as the Internet to research the following information:

1. **Landmasses**
   What did the surface of the Earth look like? Illustrate the arrangement of landmasses and/or continents.

2. **Climate**
   What was the climate like? Was there an ice age? Was it very warm?

3. **Earth Events**
   What major Earth events occurred during the period? Was there widely distributed volcanic activity, an asteroid impact, or the formation of large mountain belts?

4. **Organisms**
   What plant and animal groups lived during the period? What organisms became extinct?

### Tips
- As a part of your presentation, illustrate a 12-hour clock and mark the span of the period on the clock. Hint: Each hour corresponds to 375 million years.
- Include photographs of plant and animal fossils or artist renditions of organisms that lived during the period.

**ERAS** | **PERIODS**
---|---
Cenozoic | Quaternary
| 2 mya to present
| Tertiary
| 65-2 mya
Mesozoic | Cretaceous
| 145-65 mya
| Jurassic
| 200-145 mya
| Triassic
| 250-200 mya
Paleozoic | Permian
| 300-250 mya
| Carboniferous
| 360-300 mya
| Devonian
| 420-360 mya
| Silurian
| 445-420 mya
| Ordovician
| 490-445 mya
| Cambrian
| 540-490 mya
Precambrian | Precambrian
| 4,500-540 mya
How do artists start with a skeleton and turn it into a realistic animal drawing?

After finding and reconstructing a dinosaur skeleton, scientists often work with artists to recreate what the animal may have looked like in real life. **Take a look at the steps that artists use to create a lifelike dinosaur.**

1. **Add a body**
   Using a pencil and tracing paper, outline where you think the dinosaur’s muscles and flesh might have been. Show the shape of the arm and thigh and how they attach to the body.
   **Tip:** Think about whether some areas on the dinosaur’s body have more flesh than others. Also think about living animals with a similar body form, like a chicken or ostrich.

2. **Add shading**
   Use short, light strokes to create shadows to make your dinosaur look more lifelike. Use firmer strokes to refine the dinosaur’s outline, eyes, nostrils, and claws.
   **Tip:** Pretend a light is shining from the upper left corner. Where would the shadows be?

3. **Add details**
   Add skin texture, feathers, or scaly skin. Then color your dinosaur.
   **Tip:** Use your imagination! Some dinosaurs had scaly skin; some had feathers. Fossils don’t tell us anything about skin color or patterns, so pick a color (or colors) you think this animal may have had.

---

**Now It’s Your Turn!**

Follow the steps to flesh out this Velociraptor skeleton.

Visit [www.dinosalive.com/education](http://www.dinosalive.com/education) to download larger skeletons of Velociraptor and other dinosaurs.
Join paleontologists as they hunt for dinosaur fossils around the world. Then experience these fascinating creatures on the big screen through the power of computer-generated imagery!

Visit [www.dinosalive.com/education](http://www.dinosalive.com/education) to find:

- interactive dino puzzle & movie storyboard
- hands-on classroom activities
- recommended books and websites
